

7.3 Amount of an Annuity

Annuity: A series of equal payments made at regular intervals (savings plan, paying off a debt, etc.)

Last June 30, Nigel decided to save for a trip when he graduates. Starting next June 30, and for each of the following 3 years, he plans to deposit \$700 into an account that pays 4.5%/a, compounded annually. How much money will Nigel have accumulated when he makes the last deposit into this annuity?

- How much is each deposit worth at the end of the 4 years?
How much money in total did Nigel accumulate?

$$\begin{aligned} \text{Total} &= 700(1.045)^3 + 700(1.045)^2 + 700(1.045) + 700 \\ &= \$2994.74 \end{aligned}$$

- Annuity Formulas:

$$A = \frac{R[(1+i)^n - 1]}{i}$$

- Use this to find the amount.

$$R = \frac{Ai}{[(1+i)^n - 1]}$$

- Use this to find the regular payment.

- where
- A = Amount at the time of the last payment
- R = Regular payment
- i = Interest rate per compound pd.
- n = # of compound periods/# of payments

Ex. 1 Mary deposits \$250 into an account at the end of each month paying 7.2%/a compounded monthly for 5 years. How much money will she have at the end of 5 years?

By Hand:

Given

$$R = 250$$

$$i = \frac{0.072}{12}$$

$$n = 12 \times 5 = 60$$

$$A = \frac{R[(1+i)^n - 1]}{i}$$

$$= \frac{250 \left[\left(1 + \frac{0.072}{12}\right)^{60} - 1 \right]}{\frac{0.072}{12}}$$

$$\approx 17991.18$$

By TVM:

APPS , 1: Finance..., ENTER , 1: TVM Solver... ENTER

N	= # of compounding periods	<p>TAKE NOTE: In annuities N = number of compounding periods <u>not</u> years.</p>
I%	= interest rate/a as a percent	
PV	= present value (P)	
PMT	= the payment amount (put as "0" if there are no payments)	
FV	= future value (A)	
P/Y	= number of payments per year (put as "1" if there are no payments)	
C/Y	= number of compound periods per year	
PMT:	= choose END	

N	= 5 x 12 = 60
I%	= 7.2
PV	= 0
PMT	= -250
FV	= □ → 17991.18
P/Y	= 12
C/Y	= 12
PMT:	END BEGIN

Ex. 2 Cameron wants to be an astronaut and needs to save for university. He plans on making regular bi-weekly deposits into an account paying 5.3%/a compounded bi-weekly. If he wants to have \$9000 in 3 years, how much does he need to deposit each time?

By Hand

$$R = \frac{A \cdot i}{(1+i)^n - 1}$$

$$= \frac{9000 \left(\frac{0.053}{26} \right)}{\left(1 + \frac{0.053}{26} \right)^{78} - 1}$$

Given

$$A = 9000$$

$$i = \frac{0.053}{26}$$

$$n = 26 \times 3 = 78$$

$$= 106.57$$

By TVM

$N = 26 \times 3 = 78$ $I\% = 5.3$ $PV = 0$ $PMT = \square \rightarrow -106.57$ $FV = 9000$ $P/Y = 26$ $C/Y = 26$ $PMT: \text{END} \text{ BEGIN}$
--

\therefore Cam's pmts are
\$106.57

Ex. 3 Who wants to be a Millionaire?

You want to know how much to put away every month, from now until you retire, to become a millionaire. Assume interest at 5% compounded monthly, and that you retire at 65.

$$65 - 16 \\ = 49$$

$N = 49 \times 12 \rightarrow 588$
$I\% = 5$
$PV = 0$
$PMT = \boxed{} \rightarrow -395.71$
$FV = 1,000,000$
$P/Y = 12$
$C/Y = 12$
$PMT: \text{END} \text{ BEGIN}$

\therefore You will need \$395.71 as
monthly payment
